# New Eclipse Aided Cortical test

## Aided benefit **made** clear

**With the new Aided Cortical test for the Eclipse, you have access to a tool that can help you reliably validate hearing aid and cochlear implant fittings in infants and patients with complex needs who cannot subjectively respond.**

The Aided Cortical test measures the brain's response to speech sounds amplified via a hearing aid or a cochlear implant. You can use the test result to counsel your patient's family and make informed adjustments to the hearing device settings.

The test includes the new ManU-IRU stimulus developed by the Interacoustics Research Unit (IRU) in collaboration with Manchester University.

**Learn more at [interacoustics.com](https://interacoustics.com)**

**Objectively validate  
the benefit of the  
hearing device fitting  
in infants and in  
patients with  
complex needs**

*The Aided Cortical software can be used as standalone module on Eclipse or combined with other of the Eclipse software modules..*
